

## ABSTRACT OF THE INVENTION

A wind-deflecting device for a convertible includes a center part of the wind-deflecting device, which in its upright operating position is arranged between spaced-apart bar sections of a rollover bar and is held in place on the rollover bar via releasable locking connections. Each releasable locking connection includes a receiver fixed to the rollover bar and interlocking with a laterally supported holding element of the center part. The locking connection further has a pivotably supported spring-loaded notch lever to release the locking connection. To enable the releasable locking connection to be released from a sitting position and to increase ease of operation, the notch lever is arranged on the fixed receiver and a pushbutton interacting with the notch lever is provided on the receiver to pivot the notch lever.
